NimbusDesk Customer Feedback Report - Q3 2026

Prepared by the Customer Success team. This report summarises the Q3 2026 customer survey, support ticket themes and churn interviews. The survey received 412 responses from admins and agents across 1,200 paying accounts.

1. Net Promoter Score

Net Promoter Score (NPS) fell from 38 in Q2 2026 to 31 in Q3 2026. The drop is concentrated in accounts with 11 to 50 seats, where NPS fell from 35 to 22. Accounts with 1 to 10 seats and accounts with more than 50 seats were broadly stable.

2. Top feature requests

The most requested feature is AI-suggested ticket replies, requested by 187 respondents. Second is a WhatsApp integration, requested by 164 respondents. Third is SLA breach alerts, requested by 121 respondents. Dark mode was requested by 44 respondents.

Agents who asked for AI-suggested replies said they spend roughly 40 percent of their working day typing answers to repeated questions such as password resets, refund status and delivery delays. Several admins said faster first replies are the main thing their own customers judge them on.

Of the 164 WhatsApp integration requests, 61 percent came from accounts with 11 to 50 seats, mostly retail and D2C brands in India and Brazil. These customers say their own buyers already message them on WhatsApp and the conversations stay outside NimbusDesk, so nothing is tracked.

3. Support ticket themes

Across 6,300 support tickets raised by our customers to NimbusDesk support in Q3, the top themes were: slow search inside large ticket histories (22 percent), confusion about SLA settings (17 percent), reporting and export limits (14 percent) and billing questions (11 percent).

4. Churn interviews

We interviewed 23 accounts that cancelled in Q3. Nine said the lack of a WhatsApp channel was the main reason they left. Six said their agents were too slow and a competitor helped them reply faster. Four cited price. Four cited other reasons such as company closure.

5. Customer Success team operations

Internal note: the Customer Success team currently coordinates weekend shift swaps and on-call cover through a WhatsApp group. Because messages get lost, the team plans to move shift coordination to a dedicated Slack channel in November. This note concerns internal staffing only.

Two Customer Success managers attended an AI customer experience conference in Singapore in September. Talks covered AI chatbots, AI reply tone and AI in call centres. Travel costs were within budget and the team shared slides internally.

6. Customer concerns and risks

Not every customer wants automation. 38 percent of respondents from accounts with more than 50 seats said they would only use AI-suggested replies if a human must approve each reply before it is sent. Several worried about wrong answers going to their customers and damaging trust.

On WhatsApp, 27 percent of interested respondents asked who pays the WhatsApp Business API per-conversation fees. Many said they would not pay more than 10 percent extra per agent for it. A few raised data privacy questions about storing WhatsApp chats in NimbusDesk.

7. Summary from Customer Success

Customer Success recommends treating faster replies and a WhatsApp channel as the two biggest drivers of satisfaction for the 11 to 50 seat segment, while keeping human approval as an option for larger accounts.
