NimbusDesk Product Usage Analytics - Q3 2026

Prepared by the Data and Analytics team. All numbers are for July to September 2026 unless stated.

1. Accounts and churn by segment

NimbusDesk has 1,200 paying accounts and 9,800 monthly active agents. Segment 1 to 10 seats has 520 accounts with monthly churn of 2.1 percent. Segment 11 to 50 seats has 480 accounts and its monthly churn rose from 1.4 percent in June to 2.9 percent in September. Segment 51 plus seats has 200 accounts with monthly churn of 0.8 percent.

2. Response times

Median first response time across all accounts is 4 hours 12 minutes. In the 11 to 50 seat segment it is 5 hours 40 minutes, the slowest of any segment. Canned responses are used by 72 percent of agents, but advanced macros by only 18 percent, which suggests agents still type most replies by hand.

3. Channels and retention

Ticket volume by channel is email 64 percent, web form 22 percent and live chat 14 percent. Accounts that connect at least one messaging channel in their first 30 days keep 91 percent of their seats after six months, compared with 74 percent for email-only accounts.

In accounts that requested WhatsApp, admins estimate that 35 percent of their end customers already contact them through WhatsApp outside NimbusDesk. These conversations are invisible in our reports.

4. Email engagement tracking

Our outbound product newsletter reached 8,200 admins. Email replies to the newsletter were tracked with a reply-tracking tag, and the open rate was 47 percent. Reply volume to marketing emails rose after we changed the subject lines in August.

After the database migration in August, the agent dashboard page load time improved from 3.1 seconds to 1.4 seconds. No customer-facing downtime was recorded during the migration.

5. SLA breaches

18 percent of tickets in the 11 to 50 seat segment breached their SLA in Q3, compared with 7 percent in other segments. Accounts with more than 20 percent SLA breaches were three times more likely to churn.

6. AI draft replies pilot

In August we piloted AI draft replies with 30 accounts. Median first response time fell by 34 percent. Agents accepted 58 percent of AI drafts as written and edited the other 42 percent before sending. No pilot account reported a wrong reply reaching a customer, because every draft needed a click to send.

The estimated model cost for AI draft replies is about 0.6 US dollars per agent per month at current ticket volumes, which is small compared with the per-agent price.
